### Course Scope

The Energy Auditor course is from the WAPTAC Standardized curricula and is based on a National Renewable Energy Laboratory/U.S. Department of Energy Job Task Analysis (JTA) of the same name. This two-week course provides the student with an in-depth understanding of the weatherization auditing process. Topics include diagnosing basic energy-related issues, simple moisture problems, combustion safety testing and developing a scope of work. Students will study how the house works as a system, and learn how to apply building science principles to identify, prioritize, and correct energy-related issues within the building envelope, as well as health and safety concerns associated with these issues.

I hereby agree to comply with the requirements and directions of the training program, and to supply any information relevant to safety and medical issues.
